## Professional Summary

Final-year Computer Science student specializing in AI/ML with hands-on experience building production applications, automation systems, and AI projects. Experienced in taking projects from problem definition and development to deployment, with a strong focus on practical problem-solving, reliable systems, and building software that addresses real-world use cases.

## Technical Skills

**Languages**: C, Java, Python, SQL

**Backend & Architecture**: FastAPI, REST APIs

**Databases**: MySQL, SQLite

**AI & Processing**: PyTorch, OpenCV, YOLO, HuggingFace

**Cloud & DevOps**: Google Cloud (Vertex AI), Git, GitHub Actions, CI/CD

## Experience

**Peerprep**

*Software Engineering Intern* *Mar 2026 - May 2026*

- Built an automated ingestion engine using Python to standardize and extract data from unpredictable, multi-format academic documents.
- Implemented strict validation checks, reducing per-record processing time significantly while maintaining 99.98% accuracy — informed by data-driven analysis of failure patterns across document formats.

*Tech Stack: Python, OpenCV, OCR, Git, GitHub*

## Projects

***Clinical Records & Clinic Operations System*** GitHub | Demo Video *Jul 2026 - Aug 2026*

- Built and deployed a clinical records platform used daily by clinic staff to manage patient records, medical documents, reports, reminders, checklists, and scheduling workflows.
- Added multi-role access control for administrators, medical staff, and clinical observers, with role-specific permissions for patient records, document uploads, reporting, and scheduling.
- Integrated Prisma with Neon PostgreSQL and Google Drive API for persistent record management, cloud document archival, and audit logging of system activity.

*Tech Stack: TypeScript, Next.js, Prisma, PostgreSQL (Neon), Google Drive API*

***Advanzia AutoLend - Autonomous Credit Limit Optimization*** GitHub | Live Demo *Jan 2026 - Feb 2026*

- Implemented a Dueling Double DQN-based risk optimization model for dynamic credit limit decisions, combined with a Cox Proportional Hazards Model to estimate default probabilities from simulated borrower risk profiles.
- Made a simulation pipeline using 10,000+ synthetic users to train and evaluate reinforcement learning policies under different credit risk scenarios and repayment behaviors.
- Developed supporting APIs and data workflows using FastAPI, Redis, and PostgreSQL to serve model predictions, manage simulation data, and support the evaluation pipeline.

*Tech Stack: Python, PyTorch, FastAPI, Redis, PostgreSQL*

***DOC-OC - Automated Marksheet Extraction System*** GitHub | Live Demo *Sep 2025 - Oct 2025*

- Engineered a multi-board extraction pipeline utilizing OpenCV, custom YOLOv8 object detection, and Hugging Face Table Transformers to automate structured data extraction and validation pipeline for administrative workflows.
- Built a custom structure-retaining OCR engine (via LLM Whisperer) integrated with strict fraud-mitigation checks to ensure data integrity across consecutive semesters.
- Developed a React and async FastAPI portal backed by a secure MySQL database, driving a 15x reduction in processing time (5 mins to ∼30s per marksheet).

*Tech Stack: Python, React, FastAPI, YOLOv8, HuggingFace, OpenCV, MySQL*

## Education

**Graphic Era Hill University** **Dehradun**

*B.Tech Computer Science — Artificial Intelligence and Machine Learning* *2023 – Present*

CGPA: 7.55/10.0

## SCHOLASTIC/CO-SCHOLASTIC ACHIEVEMENT

- **1st Place, MariTHON National Hackathon** - SOF extraction pipeline built and deployed using Google Cloud Vertex AI for the Integrated Maritime Exchange.
- **Finalist, HackTheWinter National Hackathon** - AI-driven dynamic credit limit optimization system using reinforcement learning.
- **Finalist, India Innovates 2026** - Qualified for the Physical Finale of the World's Largest Civic Tech Hackathon (Top 500 Teams) | Bharat Mandapam, New Delhi, India.
